

SecItem attributes for keys

This thread has been locked. Questions are automatically locked after two months of inactivity, or sooner if deemed necessary by a moderator.

1.4k

I can never remember which key attributes perform which function, so I've created a summary and I'm posting it here for the benefit of Future Quinn™ (and possibly others :-).

- kSecAttrLabel

(

'labl'

)

 - CFString
 - Is **not** a component of key uniqueness
 - kSecKeyPrintName

(1) in the legacy keychain on macOS
 - This is the user-visible description of the key; this is not particularly useful on iOS but super handy on macOS because it shows up in the *Name* column in Keychain Access
- kSecAttrApplicationLabel

(

'klbl'

)

 - CFData

(but may be a

CFString

containing a UUID)
 - /s a component of key uniqueness
 - kSecKeyLabel

(6) in the legacy keychain on macOS
 - Not user visible
 - For asymmetric keys this holds the public key hash which allows digital identity formation (to form a digital identity, this value must match the
 - kSecAttrPublicKeyHash

(

'pkhh'

) attribute of the certificate)
- kSecAttrApplicationTag

(

'atag'

)

 - CFData
 - /s a component of key uniqueness
 - kSecKeyApplicationTag

(7) in the legacy keychain on macOS
 - On macOS, this shows up in the *Comments* field in the info window in Keychain Access (accessed via *File > Get Info*)
 - The content of this is entirely up to the app

In the context of

kSecAttrApplicationLabel

, the public key hash is a SHA-1 digest of the bytes in the

subjectPublicKey

element of the

SubjectPublicKeyInfo

structure within the certificate (see Section 4.1 of [RFC 5280](#)). For example, with this key:

```
$ dumpasn1 -p key.asn1
SEQUENCE {
  SEQUENCE {
    OBJECT IDENTIFIER ecPublicKey (1 2 840 10045 2 1)
    OBJECT IDENTIFIER prime256v1 (1 2 840 10045 3 1 7)
  }
  BIT STRING
  04 07 88 9B 18 EF 92 93 6C B1 04 7F F3 81 A4 31
  0A 08 1A CE 9D E7 13 B4 B9 5A E9 04 0C 10 A2 02
  C0 0D 78 71 01 21 EE 57 C4 40 C3 86 AE 05 25 F3
  31 96 49 C9 28 31 10 A8 B9 0A 57 E1 E3 36 2C 3D
  F7
}
```

the digest covers the bytes 04 07 88 9B ... 36 2C 3D F7.

Note

dumpasn1

is a third-party tool for inspecting ASN.1 files. Download its source code [from here](#).

let myEmail = "eskimo" + "1" + "@apple.com"

Changes:

- 17 Jan 2017 — First posted.
- 13 Mar 2019 — Added a note about the public key hash. Made minor editorial changes.
- 18 Mar 2019 — Added a download link for

dumpasn1

. Made minor typographical changes.
